

ComicCraft: AI-Powered Comic Story Generator

Phase 1 – Brainstorming & Ideation

Problem Statement & Objectives

2.1 Problem Statement

The rapid advancement of Artificial Intelligence has opened new possibilities for creative content generation. However, creating comic books still requires a combination of storytelling skills, artistic ability, and considerable time. Many individuals have creative ideas but lack the drawing skills or technical knowledge needed to transform those ideas into visually appealing comics.

Traditional comic creation involves writing scripts, designing characters, illustrating scenes, arranging comic panels, and formatting the final output. This process can be time-consuming and challenging, especially for beginners, students, and hobbyists.

Although AI-powered text and image generation tools are available separately, there is a need for a unified application that combines story generation, comic-style illustration, layout creation, and PDF export into a single workflow. Providing all these features through a simple web interface can make comic creation more accessible and efficient.

ComicCraft addresses this problem by integrating AI-powered story generation and image generation into one application, enabling users to create personalized multi-panel comics from simple text prompts with minimal effort. This aligns with the project's goal of generating storylines, illustrations, and downloadable comics through an integrated workflow.

2.2 Objectives

The primary objective of ComicCraft is to develop a web-based application that automatically generates personalized comic stories using Artificial Intelligence.

The specific objectives of the project are:

To design a simple and interactive web interface for collecting user inputs.

To generate a structured comic outline using Google's Gemini Flash model.

To create detailed story narration and dialogues using Gemini Pro.

To generate comic-style illustrations for each panel using Stable Diffusion.

To organize the generated text and images into a structured comic layout.

To provide users with a preview of the generated comic before downloading.

To export the completed comic as a professionally formatted PDF.

To demonstrate the practical application of Generative AI in creative storytelling and digital content generation. These objectives reflect the workflow and modules described in the project documentation.
