

ComicCraft: AI-Powered Comic Story Generator

Phase 1 – Brainstorming & Ideation

Project Introduction & Background

Introduction

Artificial Intelligence (AI) has transformed the way digital content is created by enabling computers to generate text, images, and other forms of media with minimal human intervention. One of the most exciting applications of AI is creative storytelling, where advanced language models and image generation models work together to produce engaging visual content. This has made it possible for users with little or no artistic experience to create stories, illustrations, and comics quickly and efficiently.

ComicCraft is an AI-powered web application developed to simplify the creation of personalized comic stories. The application combines Google's Gemini AI models with Stable Diffusion to generate comic narratives and corresponding illustrations from simple text prompts. Users provide information such as the story prompt, main character name, setting, tone, and preferred art style through an interactive web interface. Based on these inputs, the system automatically generates a structured comic storyline, creates detailed narration for each panel, produces AI-generated comic illustrations, and compiles the final output into a downloadable PDF. This workflow is consistent with the implementation described in the project documentation.

The application is developed using the FastAPI framework, while HTML, CSS, and Jinja2 templates are used to create a responsive and user-friendly interface. The modular design of the project separates story generation, image generation, layout creation, and PDF export into independent components, making the application easier to understand, maintain, and extend in the future.

ComicCraft demonstrates how Generative AI can support creative content generation by combining natural language processing and image synthesis within a single application. The project serves as a practical example of integrating modern AI technologies into web development while providing users with an enjoyable and interactive experience for creating personalized comics.
