

ComicCraft: AI-Powered Comic Story Generator

Phase 1 – Brainstorming & Ideation

Project Scope & Motivation

1.2 Scope of the Project

The scope of ComicCraft is to provide a web-based platform that enables users to generate personalized comic stories using Artificial Intelligence. The application automates the complete comic creation process, beginning with user input and ending with the generation of a downloadable comic in PDF format.

The project focuses on integrating text generation, AI-powered image creation, comic layout management, and PDF generation into a single workflow. Users can customize their comics by providing a story prompt, selecting the main character, choosing a setting, defining the story tone, and specifying an art style. Based on these preferences, the application produces a five-panel comic with narration and illustrations.

Although the current version supports single comic generation without user authentication or cloud storage, its modular architecture allows future enhancements such as user accounts, comic history, additional art styles, multilingual support, and cloud deployment.

1.3 Motivation

Creating comic books traditionally requires artistic skills, creative writing abilities, and significant time. Many individuals have interesting story ideas but lack the resources or experience needed to convert those ideas into visual comics. Recent advances in Generative AI provide an opportunity to automate much of this process.

The motivation behind ComicCraft is to develop a simple and accessible platform that enables anyone to create visually appealing comics from natural language prompts. By combining AI-based storytelling with automatic image generation, the project reduces the effort required to create comics while encouraging creativity and experimentation. It also provides practical experience in integrating modern AI technologies into web applications, making it a valuable learning project in the field of Artificial Intelligence and Full Stack Development.
