

ComicCraft: AI-Powered Comic Story Generator

Technology Selection & Analysis

3.4 Why These Technologies Were Chosen

The technologies used in ComicCraft were selected based on their reliability, ease of development, and compatibility with Artificial Intelligence applications. Python and FastAPI provide a lightweight and efficient backend environment, while HTML, CSS, and Jinja2 enable the creation of a responsive and user-friendly interface.

Google Gemini Flash and Gemini Pro were chosen because they support structured story generation and detailed narrative creation. Stable Diffusion complements these models by producing AI-generated comic illustrations from textual prompts. FPDF simplifies the process of exporting the final comic into a portable PDF document that users can save and share.

The combination of these technologies creates a modular and scalable application that efficiently transforms user ideas into complete AI-generated comic stories
